A Few Brief Comments on the R Versions

1. Since the variable names have been adopted from the respective SAS and Fortran sources in a 1:1 manner, no new lists of definitions are needed.

2. All ordinary R scripts can be run simply by loading the respective file in the R editor and entering a RUN command as soon as the input values have been replaced by the current ones.

3. For all programs executing a DLL which has been generated by compiling a Fortran souce under R, a batch file has been provided which can be run directly from the editor (again after updating the input values). The only prerequisite is that all files involved are stored in the current working directory.
